

# POWER OUTAGES, FOOD SPOILAGE & INSURANCE RISK

## POWER OUTAGES, FOOD SPOILAGE, AND INSURANCE RISKS

The risk of power outages is increasing as a result of the current energy crisis. Consumers wonder how long their food will remain fresh and edible, but retailers must act immediately to prevent unnecessary spoilage. Imagine the power comes back on after 4 hours, the store manager can make an educated decision on food quality and safety, based on Axino's Core Temperature Intelligence (CTI) system. Deciding to either remove the impacted food groups, or keep it in stock if the Core Temperature has been not outside the compliance range. .

Food spoilage insurance coverage is a way retailers can protect themselves from the risks of prolonged power outages, equipment breakdowns, or mechanical failures. But that insurance coverage comes at a cost.

Axino reduces the risk of food spoilage by determining the relevant Core Temperature thresholds, 24/7. This helps retailers to make effective decisions minimising the cost of food waste, and mitigating the risk of blackouts and mechanical failures.

It's a win-win situation:

- Retailers can negotiate better conditions for their food spoilage insurance , and
- Insurers experience a reduction in payout for unneeded food spoilage instances

## Core Temperature Intelligence Highlights

- Negotiable insurance policy with CTI insights
- Be proactive to prevent food spoilage and waste
- With CTI retailers know how long food will remain fresh and edible after power outage

## Core Temperature Intelligence Features

- Suitable for all food groups
- Plug-and-play, suitable for cold-rooms
- Independent of store power and network supply
- End-to-end encryption & reliable data recording
- Fully auditable data for food safety inspections

*"Integrating Axino Core Temperature Intelligence can help you save on insurance policy with automated food monitoring systems "*
